Subject: Draft Sampling Strategy - Confidential
Attachments: removed.txt

Attorney Client Discussion

DTSC's Role

1. Provide recommendation on contractor to be used for sampling effort;
2. Set up agreement with developer for reimbursement of costs associated with sampling effort;
3. Develop sampling strategy for EPA collaborative review;
4. Review and approve work plan for field activities;
5. Coordinate with selected contractor for implementation of field activities;
6. Collect all soil and groundwater samples for PCB analysis;
7. Provide split samples as requested;
8. Pack, seal and hand-off all soil and groundwater samples to the DTSC contract laboratory;
9. Confirm with laboratory that samples were received with chain-of-custody and custody seals intact;
10. Share data with EPA as it becomes available;
11. Review laboratory data package;
12. Develop data transmittal;
13. Collaborate with EPA on data transmittal; and,
14. Post completed data transmittal and raw data packages on EnviroStor.

Contractor's Role

1. Develop work plan for soil and groundwater sampling based on DTSC and EPA recommendations, and submit to DTSC and EPA for review, comment, comment resolution, and approval;
2. Provide logistical support for soil sampling, including procurement of sampling equipment, sample containers, location devices, etc.;
3. Coordinate the permitting and installation of groundwater monitoring wells and provide support needed for collection of groundwater samples; and,
4. Provide support as requested by DTSC on final data transmittal.

EPA's Role

1. Collaborate with DTSC on sampling strategy;
2. Review and approve work plan for field activities;
3. Provide field oversight as determined necessary by EPA;
4. Collect field split samples as determined necessary by EPA; and,
5. Collaborate with DTSC on data transmittal.

Developer's Role

1. Retain consultant as recommended by DTSC;
2. Reimburse DTSC for costs associated with sampling effort; and,
3. Provide access to the Riverside Ag Park property.

Soil Sampling

1. Options evaluated for soil sampling include:
 - a. 200 foot grid samples (n=38)

- b. 250 foot grid samples (n=27)
- c. Random sampling derived from DTSC Agricultural Site Sampling Guidance (n=20)
- d. Each lot (n=111 samples)
2. Sampling of each lot is recommended;
3. Samples will be collected from a depth of 0-3 inches;
4. EPA/developer may collect split samples;
5. Samples will be collected using a disposable trowel (trowels will not be re-used);
6. Sample location may be recorded using a handheld GPS device;
7. Samples will be packaged, sealed, and provided to the laboratory's courier for delivery;
8. Samples will be analyzed for PCBs; and,
9. Laboratory will be instructed to ensure that the method detection limits are set at or below 0.24/mg/kg.

Groundwater

1. Two new groundwater monitoring well installations will be installed in the vicinity of the former groundwater monitoring wells MW-6 and MW-7 which exhibited the historically highest PCB results;
2. The new wells may be installed by first installing a conductor casing to an approximate depth of 2 feet above first encountered groundwater and sealed in place. Groundwater monitoring well construction should be completed through the annulus of the conductor casing to the total depth of the well;
3. Appropriate well construction design should be utilized to ensure the highest quality groundwater samples are collected. Well screen slots and filter pack sand should be designed based on the encountered grain size of the formation screened by the well. Appropriate well screen design should facilitate proper well development resulting in the lowest sample turbidity achievable;
4. The new groundwater wells should be purged and sampled utilizing "Low Flow" purge and sampling technique as described in USEPA guidance;
5. Groundwater samples will be analyzed for PCBs by a DTSC's contract laboratory;
6. EPA/developer may collect duplicate or split samples;
7. Laboratory will be instructed to ensure that the method detection limits are set at the lowest level achievable by the method; and,
8. Groundwater samples may be collected quarterly up to one year, based on sampling analytical results. Additional sampling may be warranted, based on concentrations of PCBs detected in groundwater.
